# Non-planar pose estimation

- ▶ Homography maps only plane to plane
- ▶ More general object pose estimation in **camera** frame
  - ▶ get depth by mapping from area in pixels to depth for fixed size objects
  - ▶ get depth by additional scene information, e.g. known size/model of the objects
  - ▶ RGBD camera
  - ▶ additional markers

## Using prior knowledge about size

- ▶ We know radius is fixed

## Using prior knowledge about size

- ▶ We know radius is fixed
- ▶ From detected pixels  $\mathbf{u}_1, \mathbf{u}_2$ , we can compute rays  $\mathbf{x}_1, \mathbf{x}_2$ :

$$\frac{1}{\lambda_i} \mathbf{x}_i = K^{-1} \mathbf{u}_i$$

## Using prior knowledge about size

- ▶ We know radius is fixed
- ▶ From detected pixels  $\mathbf{u}_1, \mathbf{u}_2$ , we can compute rays  $\mathbf{x}_1, \mathbf{x}_2$ :

$$\frac{1}{\lambda_i} \mathbf{x}_i = K^{-1} \mathbf{u}_i$$

- ▶ Angle between vectors:  $\cos \alpha = \frac{\frac{1}{\lambda_1 \lambda_2} \mathbf{x}_1 \cdot \mathbf{x}_2}{\frac{1}{\lambda_1 \lambda_2} \|\mathbf{x}_1\| \|\mathbf{x}_2\|}$

## Using prior knowledge about size

- ▶ We know radius is fixed
- ▶ From detected pixels  $\mathbf{u}_1, \mathbf{u}_2$ , we can compute rays  $\mathbf{x}_1, \mathbf{x}_2$ :

$$\frac{1}{\lambda_i} \mathbf{x}_i = K^{-1} \mathbf{u}_i$$

- ▶ Angle between vectors:  $\cos \alpha = \frac{\frac{1}{\lambda_1 \lambda_2} \mathbf{x}_1 \cdot \mathbf{x}_2}{\frac{1}{\lambda_1 \lambda_2} \|\mathbf{x}_1\| \|\mathbf{x}_2\|}$

- ▶ Depth:  $z = \frac{r}{\sin(\alpha/2)}$

# Using depth sensor

## ▶ RGBD sensors

- ▶ RGB image ( $H \times W \times 3$ )
- ▶ Depth map ( $H \times W \times 1$ ), distance in meters for each pixel
- ▶ Structured point cloud ( $H \times W \times 3$ ),  $(x_c \ y_c \ z_c)$  for each pixel

## How depth sensor works

- ▶ Laser projects pattern and camera recognizes it
- ▶ Depth information is computed using triangulation

## 2D depth sensors

- ▶ Based on the structured light
- ▶ Projects 2D infra red patterns
- ▶ One projector and two cameras (RGB + IR)

## Issues with depth sensors

- ▶ Depth reconstruction is not perfect (black areas in the image<sup>3</sup>)
- ▶ In python represented by NaN
- ▶ Not every pixel in RGB has reconstructed depth value
- ▶ RGB and Depth data are not aligned (you need to calibrate them)

<sup>3</sup><https://commons.wikimedia.org>, User:Kolossos

## Additional markers

- ▶ Can we compute the pose of patterns<sup>4</sup>?

## Additional markers

- ▶ Can we compute the pose of patterns<sup>4</sup>?
  - ▶ the size and structure needs to be known
  - ▶ subpixel accuracy
  - ▶ it has to be completely visible
- ▶ Can we compute the pose of ArUco markers?
  - ▶ less accurate than regular patterns
  - ▶ provides marker id and the pose
  - ▶ it has to be completely visible

## Markers pose example

## ChArUco board for calibration

- ▶ Combines accuracy of pattern with detections of ArUco
- ▶ Partial visibility detections

## Camera matrix estimation with boards

- ▶ We can estimate camera matrix from correspondences in image space and spatial space
  - ▶ collect images of the board from different views
  - ▶ detect boards
  - ▶ compute correspondences between image points and board frame points
  - ▶ `_, K, dist_coeffs, rvecs, tvecs = cv2.calibrateCamera(obj_points, img_points, img_shape)`
- ▶ In addition we get
  - ▶ distortion coefficients that compensates defects of objective
    - `Knew, roi = cv.getOptimalNewCameraMatrix(K, dist_coeffs, img_shape, 1, img_shape)`
    - `img_undistorted = cv.undistort(img, K, dist_coeffs, None, Knew)`
  - ▶  $SE(3)$  poses of boards in camera frame

# Pose estimation from RGB(D)

- ▶ Pose estimation methods
  - ▶ use prior knowledge about the task, e.g. fixed height objects on a plane
  - ▶ use prior knowledge about the objects (size)
  - ▶ use depth sensor
  - ▶ use ArUco markers

# Pose estimation from RGB(D)

- ▶ Pose estimation methods
  - ▶ use prior knowledge about the task, e.g. fixed height objects on a plane
  - ▶ use prior knowledge about the objects (size)
  - ▶ use depth sensor
  - ▶ use ArUco markers
- ▶ Where is robot?

# Pose estimation from RGB(D)

- ▶ Pose estimation methods
  - ▶ use prior knowledge about the task, e.g. fixed height objects on a plane
  - ▶ use prior knowledge about the objects (size)
  - ▶ use depth sensor
  - ▶ use ArUco markers
- ▶ Where is robot?
  - ▶ homography estimates poses of objects w.r.t. plane frame

# Pose estimation from RGB(D)

- ▶ Pose estimation methods
  - ▶ use prior knowledge about the task, e.g. fixed height objects on a plane
  - ▶ use prior knowledge about the objects (size)
  - ▶ use depth sensor
  - ▶ use ArUco markers
- ▶ Where is robot?
  - ▶ homography estimates poses of objects w.r.t. plane frame
  - ▶ other methods estimate poses in camera frame

# Pose estimation from RGB(D)

- ▶ Pose estimation methods
  - ▶ use prior knowledge about the task, e.g. fixed height objects on a plane
  - ▶ use prior knowledge about the objects (size)
  - ▶ use depth sensor
  - ▶ use ArUco markers
- ▶ Where is robot?
  - ▶ homography estimates poses of objects w.r.t. plane frame
  - ▶ other methods estimate poses in camera frame
  - ▶ we need to estimate/calibrate  $T_{RC}$

# HandEye calibration

- ▶ Camera can be mounted w.r.t.
  - ▶ robot base frame (eye-to-hand calibration)
  - ▶ gripper frame (eye-in-hand calibration)

## HandEye calibration

- ▶ Camera can be mounted w.r.t.
  - ▶ robot base frame (eye-to-hand calibration)
  - ▶ gripper frame (eye-in-hand calibration)
- ▶ Solve  $A^i X = Y B^i$ 
  - ▶ measurements:  $A^i, B^i \in SE(3)$
  - ▶ estimated parameters:  $X, Y \in SE(3)$

## HandEye calibration

- ▶ Camera can be mounted w.r.t.
  - ▶ robot base frame (eye-to-hand calibration)
  - ▶ gripper frame (eye-in-hand calibration)
- ▶ Solve  $A^i X = Y B^i$ 
  - ▶ measurements:  $A^i, B^i \in SE(3)$
  - ▶ estimated parameters:  $X, Y \in SE(3)$
- ▶  $X, Y = \text{calibrateRobotWorldHandEye}(A, B)$

## HandEye calibration

- ▶ Camera can be mounted w.r.t.
  - ▶ robot base frame (eye-to-hand calibration)
  - ▶ gripper frame (eye-in-hand calibration)
- ▶ Solve  $A^i X = Y B^i$ 
  - ▶ measurements:  $A^i, B^i \in SE(3)$
  - ▶ estimated parameters:  $X, Y \in SE(3)$
- ▶  $X, Y = \text{calibrateRobotWorldHandEye}(A, B)$
- ▶ Eye-to-hand calibration
  - ▶  $A^i = T_{RG}^i$
  - ▶  $B^i = T_{CT}^i$
  - ▶  $X = T_{GT}$
  - ▶  $Y = T_{RC}$

# HandEye calibration

- ▶ Camera can be mounted w.r.t.
  - ▶ robot base frame (eye-to-hand calibration)
  - ▶ gripper frame (eye-in-hand calibration)
- ▶ Solve  $A^i X = Y B^i$ 
  - ▶ measurements:  $A^i, B^i \in SE(3)$
  - ▶ estimated parameters:  $X, Y \in SE(3)$

  - ▶  $B^i = T_{CT}^i$
  - ▶  $X = T_{GT}$
  - ▶  $Y = T_{RC}$
- ▶ Eye-in-hand calibration
  - ▶  $A^i = T_{CT}^i$
  - ▶  $B^i = T_{GR}^i$
  - ▶  $X = T_{TR}$
  - ▶  $Y = T_{CG}$

# Summary

- ▶ Image representation
- ▶ Projection to/from image
- ▶ Segmentation in image space
- ▶ Homography
- ▶ Pose estimation from image
- ▶ Camera calibration

# Laboratory

- ▶ No new homework this week
- ▶ Homography estimation on toy example in Python/OpenCV
- ▶ HandEye calibration on toy example in Python/OpenCV
